Numbers

Cost	Execution Time (sec)	# Nodes Expanded	Pacman Score
210	0.0	390	300.0

Question 2 – Tiny BFS

Screenshot

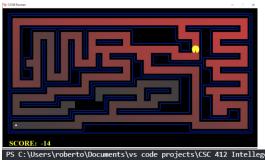

```
PS D:\cbu\CSC412\Pacman-Search1\search> python2 pacman.py -1 tinyMaze -p SearchAgent -a fn=bf:
[SearchAgent] using function bfs
[SearchAgent] using problem type PositionSearchProblem
(1, 1)
Path found with total cost of 8 in 0.0 seconds
Search nodes expanded: 15
Pacman emerges victorious! Score: 502
Average Score: 502.0
Scores: 502.0
Win Rate: 1/1 (1.00)
Record: Win
PS D:\cbu\CSC412\Pacman-Search1\search>
```

Cost	Execution Time (sec)	# Nodes Expanded	Pacman Score
8	0.0	15	502.0

Question 2 – Medium BFS

Screenshot

SCORE: -14

PS C:\Users\roberto\Documents\vs code projects\CSC 412 Intellegence Systems\searchPacman\Pacma nSearch1> python2 pacman.py -1 mediumMaze -p SearchAgent -a fn=bfs

[SearchAgent] using function bfs

[SearchAgent] using problem type PositionSearchProblem
(1, 1)

Path found with total cost of 68 in 0.0 seconds

Search nodes expanded: 269

Pacman emerges victorious! Score: 442

Average Score: 442.0

Scores: 442.0

Win Rate: 1/1 (1.00)

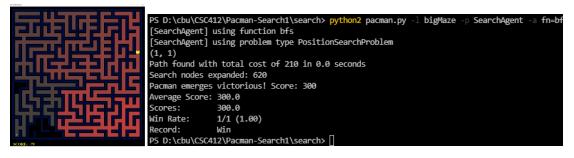

Record: Win

210	0.1	549	300.0

Summary

Summary Chart

The following chart summarizes the individual results provided in the previous section:

Alg.	Maze	Cost (Solution Quality)	Execution Time (s)	# Nodes (Time Complexity)
DFS	Tiny	10	0.0	15
	Med	130	0.1	146
	Big	210	0.0	390
BFS	Tiny	8	0.0	15
	Med	68	0.0	269
	Big	210	0.0	620
UCS	Tiny	8	0.0	15
	Med	68	0.0	269
	Big	210	0.2	620
A*	Tiny	8	0.0	14
	Med	68	0.0	221
	Big	210	0.1	549

Summary Explanation

There were some interesting observations when comparing the four search algorithms across each maze size and application. Firstly, DFS demonstrated a slight slowdown as the size of the maze was increased. This could mostly be due to how depth first search is designed to look for the goal state. For instance, as DFS searches, it goes through the deepest nodes in the search tree before returning to the next node and following it to its deepest path. We also observe the ratio of nodes searched is smaller than the other search algorithms. This observation is expected because UCS and BFS are expected to follow the same base style of algorithm that searches the entire tree of opportunities and therefore searches through all the nodes before identifying the most optimal. Thus, it is reasonably expected for the number of nodes explored for all maze sizes to be the same for BFS and UCS. Another expected observation that can be seen is the equal reported costs of BFS, UCS, and A*. This is because these algorithms are guaranteed to be optimal and complete, meaning that after searching through the tree, the resulting path is required to be the most cost efficient (specifically concerning UCS/A* since cost is not considered in BFS) and most optimal (all three).
